COFFEE

SALES ANALYSIS

Presented by
Shaikh Fatima Bee

Introduction

In today's competitive retail environment, data-driven decision-making plays a crucial role in improving business performance. This project focuses on analyzing coffee shop sales data using an interactive Excel dashboard.

The dashboard was developed to study sales trends, customer purchasing behavior, product performance, and store-level comparison. By converting raw transactional data into meaningful visual insights, the project helps management understand business performance more clearly and identify improvement opportunities.

Objective

The primary objectives of this project are:

- To analyze overall sales and customer footfall.
- To identify peak business hours and high-performing days.
- To evaluate category-wise and product-wise revenue contribution.
- To compare performance across different store locations.
- To identify underperforming products and sales gaps.
- To support strategic decision-making using data visualization.

Problem Statement

The coffee shop business was facing multiple operational and strategic uncertainties:

- Lack of clarity about peak sales hours.
- Uneven revenue distribution across weekdays.
- Heavy dependency on specific product categories.
- Differences in performance across store locations.
- Presence of low-performing products affecting efficiency.
- Limited visibility into customer purchasing patterns.

Solution

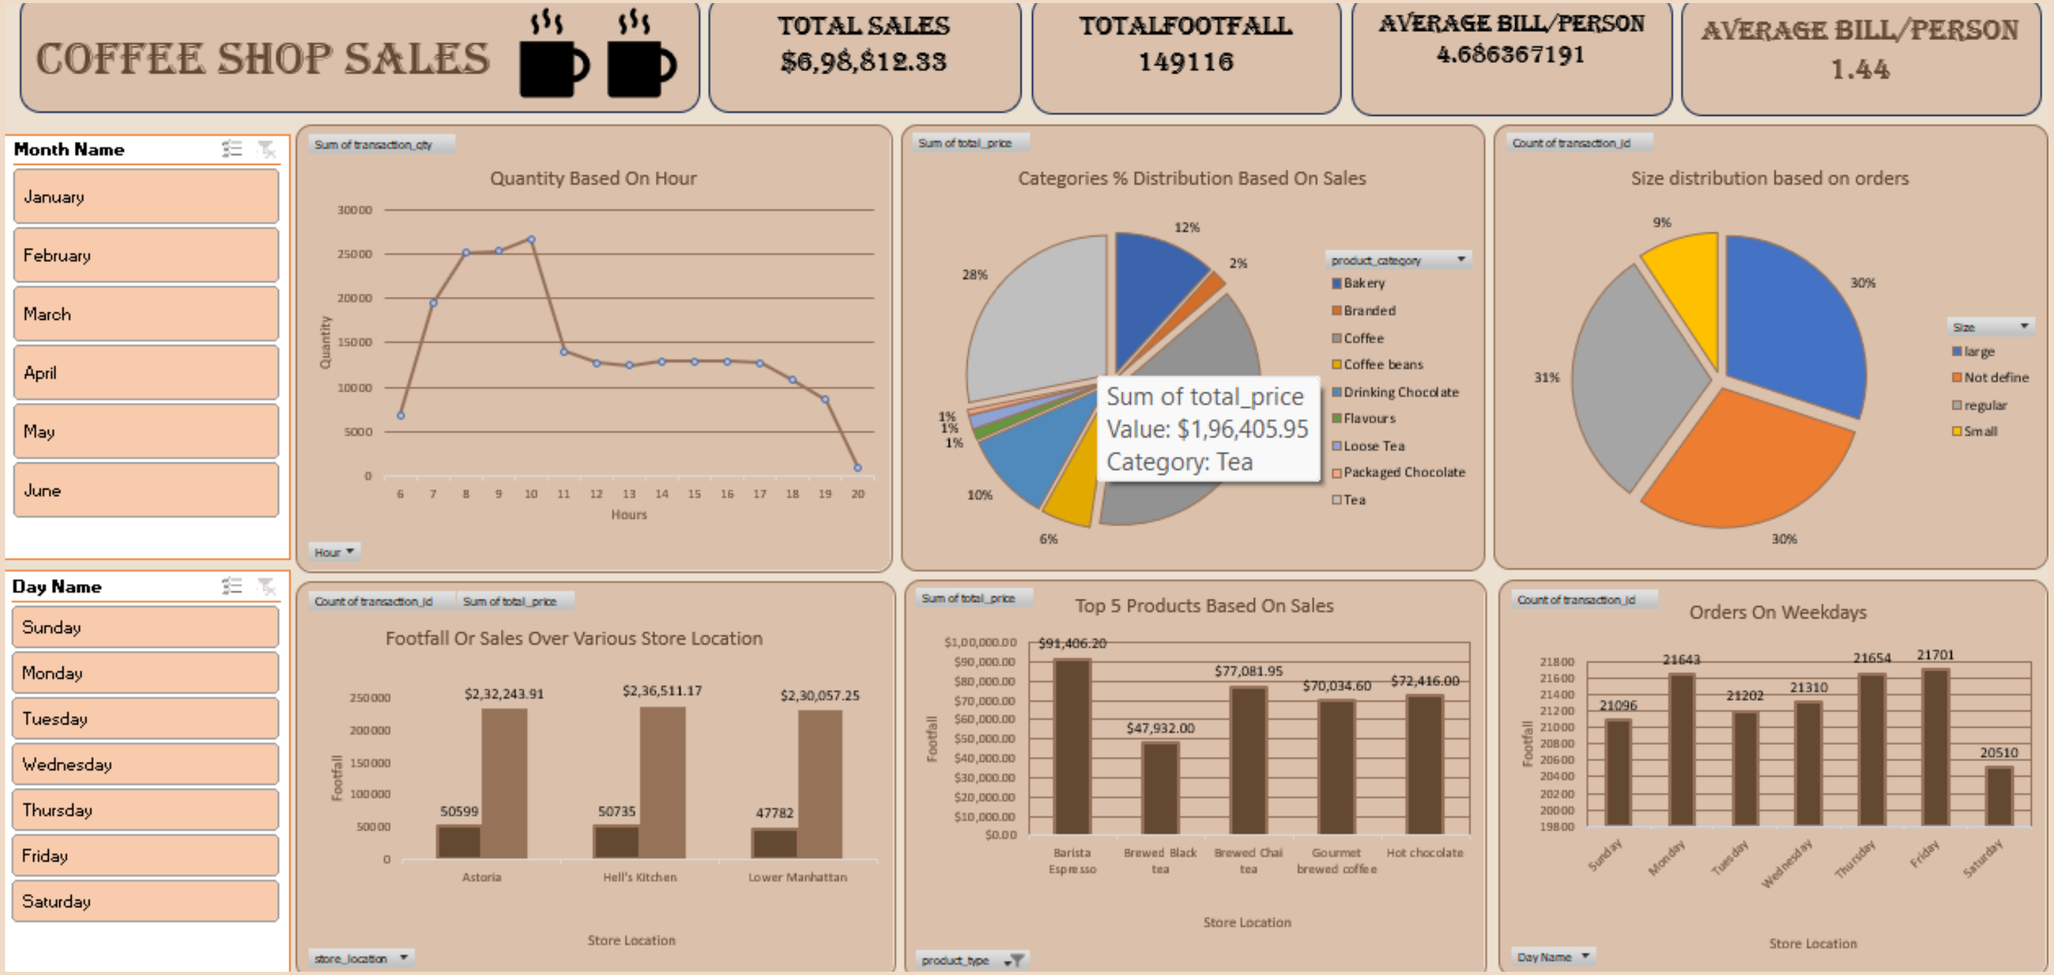
To address these challenges, an interactive Excel dashboard was created using sales transaction data.

The dashboard includes:

- Total sales and footfall tracking
- Hourly and daily sales trend analysis
- Product category contribution breakdown
- Top-performing product identification
- Store location performance comparison
- Order size distribution analysis

Dashboard

This visual and analytical approach enables quick performance monitoring and informed decision-making.



Insights

- The dashboard analysis revealed several important insights:
- Morning hours generate the highest sales volume.
- Coffee category contributes the largest share of total revenue.
- A small group of products drives a major portion of total sales.
- Certain categories contribute minimally and may require strategic review.
- Sales performance varies across weekdays.
- Store locations show slight performance differences.
- These insights help identify revenue drivers, operational gaps, and improvement areas.

Future Scope

This project can be further enhanced by:

- Incorporating profit margin and cost analysis.
- Implementing customer segmentation and behavioral analysis.
- Adding sales forecasting using predictive models.
- Integrating real-time data automation.
- Performing inventory optimization analysis.
- Expanding analysis to customer retention and loyalty programs.
- These improvements can provide deeper strategic insights and long-term business value.

Conclusion

The Coffee Shop Sales Dashboard successfully transforms raw data into actionable business intelligence.

It helps identify:

- Peak demand periods
- Revenue concentration areas
- Product performance gaps
- Store-level performance differences

By leveraging data visualization and analytical insights, the business can make more informed, strategic, and growth-oriented decisions.

THANK YOU
